Explain this error with the build: Depending on the resolving project's module coordinates has been deprecated

Assistant

This is a **Gradle deprecation warning**, not an application-code error.

The report identifies the source as the Spring dependency-management plugin:

- `build.gradle` uses `io.spring.dependency-management` version `1.1.4`.
- `gradle-wrapper.properties` uses Gradle `9.7.1`.

That plugin currently relies on the resolving project's own `group` and `version` as module coordinates. Gradle 9.7.1 deprecated that behavior and states it will become an error in Gradle 10.

The build may still complete successfully. The warning is unrelated to the Java source or MongoDB code and comes from an incompatibility between the older dependency-management plugin and newer Gradle behavior.

Recommended fixes:

1. Upgrade `io.spring.dependency-management` to a version that supports the Gradle version in use.
2. If Spring Boot's dependency management is sufficient, try removing the explicit dependency-management plugin.
3. Alternatively, use a Gradle version supported by Spring Boot `3.2.3`, rather than Gradle `9.7.1`.

The safest short-term approach is usually upgrading the dependency-management plugin first, then running the build again.

User

Change the run config to use Gradle 8.6.

Assistant

Updated `gradle/wrapper/gradle-wrapper.properties` so the Gradle wrapper uses:

```
https://services.gradle.org/distributions/gradle-8.6-bin.zip
```

Verified with `gradlew.bat --version`: **Gradle 8.6**.

User

FAILURE: Build failed with an exception.

```
* What went wrong:
A problem occurred configuring root project 'mindex-code-challenge'.
> Could not open cp_proj generic class cache for build file
  'C:\Users\isaac\RIT\Co-ops\mindex\mindex-code-challenge\build.gradle'
  (C:\Users\isaac\.gradle\caches\8.6\scripts\4u4ju83vwm7l18p13tvno9psp).
   > BUG! exception in phase 'semantic analysis' in source unit
     '_BuildScript_' Unsupported class file major version 69
```

Assistant

The error was caused by a **stale Gradle script cache** containing Java 25 bytecode:

- Unsupported class file major version `69`
- Major version `69` corresponds to Java `25`
- Gradle `8.6` is running correctly on Java `21`

The active shell was confirmed to use Java 21. Running:

```
.\gradlew.bat build --no-daemon
```

successfully rebuilt the project with Java 21 and Gradle 8.6:

```
BUILD SUCCESSFUL
```

If the error returns, stop Gradle daemons and clear only the affected cache:

```
.\gradlew.bat --stop
Remove-Item -Recurse -Force "$env:USERPROFILE\.gradle\caches\8.6\scripts"
```
